Pathogen surveillance data is updated weekly. The numbers for the last few weeks may still change slightly. This is because new reports may be added from data provided by the (current and new) laboratories participating in pathogen surveillance. In addition, numbers per week may differ from previous publications due to updates of sample collection dates or reclassification of the sample in the registration system (source and contact tracing instead of random sampling). Comprehensive data is not yet available for the latest week; these weekly figures are updated retroactively.
As of 26 November 2021, ECDC escalated B.1.1.529 variant of interest (VOI) and is therefore included in the table from now on. AY.4.2, B.1.616, B.1.620, B.1.429/429 (Epsilon), P.3 (Theta), B.1.525 (Eta), B.1.526 (Iota), B.1.617.1 (Kappa) and P.2 (Zeta) are de-escalated and removed by the WHO and ECDC. As of 20 March 2022 B1.1.7 (Alpha), B.1.621 (Lambda) and C.37 (Mu) are de-escalated and removed by the WHO and ECDC.
* The figures for BA.1, BA.2, BA.3, BA.4 and BA.5, have also been included in the total figures for the Omicron variant (B.1.1.529).
* The figures for BA.2.12.1, have also been included in the total figures for the Omicron variant (B.1.1.529) and in the totals for BA.2.
** The two recently identified samples containing the Delta variant came from care institutions.
** Due to changes in the typing tools, many samples that were previously designated as 'probable' Omicron were no longer typed as such and were placed in the 'unassigned' category. With a minor update to the typing process, this issue has been resolved. This leads to retroactive changes in the classifications.
