

Probit function technical support document

Date: 19 July 2018
Comments before: 1 September 2018
Document id: 20180719-tetraethyl lead-PROPOSED
Status: proposed
Author: L. Geraets (RIVM)
E-mail response to: safeti-nl@rivm.nl

substance name	CAS number
Tetraethyl lead	78-00-2

This draft document describes the derivation of a probit function for application in a quantitative risk analysis (QRA). The probit function has been derived according to the methodology described in RIVM report 2015-0102.

This document has been checked for completeness by the Netherlands' National Institute for Public Health and the Environment (RIVM) and has been assigned the status "proposed". The scientific expert panel on probit functions has approved this document for public discussion and comments. Interested parties are invited to submit comments and suggestions concerning this document within 6 weeks after the issue date to the email address mentioned above.

If the proposed probit function is approved by the expert panel on scientific grounds, after review and revisions following of public comments, the status of the document and probit function will be raised to "interim".

Subsequently, the Ministry of Infrastructure and the Environment will decide whether the probit function will be formally implemented. The decision on actual implementation will primarily be based on the results of a consequence analysis.

Detailed information on the procedures for the derivation, evaluation and formalization of probit functions is available at http://www.rivm.nl/en/Topics/P/Probit_functions.

1 Technical support document Tetraethyl lead

1. Substance identification

CAS-number:	78-00-2
IUPAC name:	Tetraethyl lead
Synonyms:	Tetraethyllead, lead tetraethyl, tetraethylplumbane, TEL
Molecular formula:	$C_8H_{20}Pb$
Molecular weight:	323.4 g/mol
Physical state:	liquid (at 20°C and 101.3 kPa)
Boiling point:	84°C (at 2 kPa)
Vapour pressure:	0.04 kPa (at 20°C)
Saturated vapor conc:	400 ppm = 5381 mg/m ³ (at 20°C)
Conversion factor:	1 mg/m ³ = 0.074 ppm (at 20°C and 101.3 kPa)
	1 ppm = 13.453 mg/m ³ (at 20°C and 101.3 kPa)
Labelling:	no harmonized H-sentences

2. Mechanism of action and toxicological effects following acute exposure¹

Acute effects: Information on the exact mechanism of action is not available.

The main site of action is the central nervous system. Effects included hyperexcitation, muscular tremors, convulsions, coma and death. Mild manifestations are: insomnia and nervous excitation, nausea, vomiting, associated with tremor, hyperreflexia, muscular contractions, bradycardia, arterial hypertension, and hypothermia. Most severe cases present episodes of complete disorientation, mania, ataxia, hallucinations, exaggerated muscular activity, and violent convulsive seizures, which may terminate in coma and death. In severe cases, muscle, hepatic and renal damage may occur. The clinical picture may persist for days and weeks. A rapid onset of symptoms after exposure indicates a poor prognosis. When the onset of symptoms is delayed for many days recovery is usually complete, but some neurological sequelae have been reported.

The toxic moieties in tetraethyl lead poisoning are the trialkyl metabolites and not the inorganic lead ion.

Long-term effects: No information.

3. Human toxicity data

No informative reports on human toxicity following acute inhalation exposure were identified in which details about both health effects and the exposure have been documented in sufficient detail.

4. Animal acute toxicity data

During the literature search the following technical support documents and databases were consulted:

1. No AEGL TSD, ERPG document and EU RAR was available for tetraethyl lead.
2. An additional search covering publications from 1980 onwards was performed in HSDB, MEDline/PubMed, Toxcenter, IUCLID, ECHA, RTECS, IRIS and ToxNet with the following search terms:

¹ WHO (1977, 1994); Cremer and Callaway (1961)

- 1 • Substance name and synonyms
- 2 • CAS number
- 3 • lethal*
- 4 • mortal*
- 5 • fatal*
- 6 • LC₅₀, LC
- 7 • probit

8 3. Unpublished data were sought through networks of toxicological scientists.

9

10 Animal lethal toxicity data focused on acute exposure are described in Appendix 1. A
 11 total of 4 studies were identified -with 4 datasets for 2 species- with data on lethality
 12 following acute inhalation exposure. None of the datasets was assigned status A for
 13 deriving the human probit function, one dataset was assigned status B1 and 3 were
 14 assessed to be unfit (status C) for human probit function derivation.

15

16 **Sensory irritation**

17 No studies on sensory irritation were found.

18

19

20 **5. Probit functions from individual studies**

21 All available acute lethality data on tetraethyl lead are displayed in Figure 1.

22

23

24 **Figure 1** All available acute lethality data for tetraethyl lead.

The data that were selected for initial analysis of the animal probit function are presented in Table 1 and Figure 2.

It was possible to derive a probit function for tetraethyl lead based on the only available study with B1 quality. However, this B1 study did not enable to produce a concentration-time-lethality relationship.

Probit functions have been calculated and reported in Appendix 1 for each of the reported studies. The results of the calculations are presented in Table 1.

Table 1 Data selected for initial analysis of the animal probit function of tetraethyl lead.

Study ID	Species	Probit (C in mg/m ³ , t in min)	LC ₅₀ at tested exposure duration (mg/m ³) 95% C.I.	n-value 95% C.I.
B1.1	Rat	60-min LC ₅₀	709 (C.I. could not be calculated)	N/A

The data of study B1.1 with rats are presented graphically below.

Figure 2 Data selected for the initial analysis for the derivation of the animal probit function of tetraethyl lead.

Based on criteria outlined in the guideline the data from rat study B1.1 (Cremer and Callaway, 1961) were selected for the final dataset for the derivation of the animal probit function. The data that were selected for final analysis of the animal probit function are presented in Table 2 and Figure 3.

The final data eligible for calculating the animal probit function contains one dataset from one study and includes data from one animal species.

Table 2 Data selected for the derivation of the animal probit function of tetraethyl lead.

Study ID	Species	Probit (C in mg/m ³ , t in min)	LC ₅₀ at tested exposure duration (mg/m ³) 95% C.I.	n-value 95% C.I.
B1.1		60-min LC ₅₀	709 (C.I. could not be calculated)	N/A

The data of the selected datasets are presented graphically below.

Figure 3 Final data selected for derivation of the animal probit function of tetraethyl lead (identical to figure 2).

6. Derivation of the human probit function

To derive the human probit function the results from study B1.1 (Cremer and Callaway, 1961) have been used to derive a point of departure as outlined above.

The Point of Departure for the human probit function is a 60-minute animal LC₅₀ value of 709 mg/m³ and a default n-value of 2.

The human equivalent LC₅₀ was calculated by applying the following assessment factors:

Table 3 Rationale for the applied assessment factors.

Assessment factor for:	Factor	Rationale
Animal to human extrapolation:	3	default

Nominal concentration	1	B1-study with analytically determined concentrations. There may be some issues with respect to the reliability of the applied analytical method used at that time. It is however noted that the difference between the nominal and analytical concentration is quite limited. Further, the nominal concentration is, except for the two highest test concentrations (with 100% lethality), <25% of the saturated vapour concentration.
Adequacy of database:	2	Only one B1-dataset was found. The study was performed using only one exposure duration.

1

2

3 The estimated human equivalent 60-minute LC₅₀ value is $709 / 6 = \mathbf{118 \text{ mg/m}^3}$.

4

5 No reliable experimentally determined n-value was available, so the default n-value of
6 **2** was used. Assuming a regression coefficient (b×n) of 2 for the slope of the curve,
7 the b-value can be calculated as $2 / n = \mathbf{1}$.

8

9 The human probit function is then calculated on the human equivalent 60 min LC₅₀
10 using the above parameters to solve the following equation to obtain the a-value (the
11 intercept): $5 = a + 1 \times \ln(118^2 \times 60)$ resulting in the a-value of **-8.64**.

12

13 **Pr = -8.64 + 1 × ln (C² × t) with C in mg/m³ and t in min.**

14

15 The derived human probit function has a scientifically acceptable basis. The probit
16 function is based on one study in the rat with B1 quality, including 116 animals, an
17 exposure duration of 60 minutes and response rates between 0 and 100%.

18

19 The calculated human 60 min LC_{0.1} (Pr = 1.91) calculated with this probit equation is
20 25 mg/m³ and the calculated human 60 min LC₁ (Pr = 2.67) is 37 mg/m³.

21

22

23 **Table 4** LC-values calculated with the derived probit function compared with
24 existing acute inhalation exposure guidelines.

Estimated level	30 min (mg/m ³)	60 min (mg/m ³)
0.1% lethality, this probit	36	25
1% lethality, this probit	52	37
AEGL-3	-	-
ERPG-3	-	-
LBW	-	-

25

26 A comparison with equivalent (inter)national guideline levels cannot be made.

27

Appendix 1 Animal experimental research

Study ID: B1.1

Author, year: *Cremer and Callaway (1961)*

Substance: Tetraethyl lead

Species, strain, sex: Rat, albino, sex not specified

Number/sex/conc. group: 12-20 animals/conc. group

Age and weight: age not specified; 175-230 g

Observation period: 14 days

Evaluation of study quality

Criteria	Comment
Study carried out according to GLP	<i>GLP did not exist at the time</i>
Study carried out according to OECD 403 guideline(s)	<i>OECD guideline 403 did not exist at the time</i>
Stability of test compound in test atmosphere	<i>No information</i>
Use of vehicle (other than air)	<i>No</i>
Whole body / nose-only (incl. head/nose-only) exposure	<i>Head-only. The inhalation exposures were carried out in an all-glass chamber. The apparatus was designed so that only the heads of the rats were in contact with the vapour. No further details were provided.</i>
Type of restrainer	<i>No information</i>
Pressure distribution	<i>No information</i>
Homogeneity of test atmosphere in breathing zone of animals	<i>Pure solutions of tetraethyl lead were injected into the chamber by a mechanically driven syringe. No further details were provided.</i>
Number of air changes per hour	<i>Air flow of 50 L/min</i>
Equilibration time (t95)	<i>Insufficient information to calculate t95</i>
Start of exposure relative to equilibration	<i>No information</i>
Actual concentration measurement	<i>Samples of air were taken at intervals during the 60-minute exposure period into Neal bubblers at approximately 1 litre/min through accurately calibrated critical orifices. The bubblers contained 5 ml of 100-200 petroleum ether. Tetraethyl lead was analysed polarographically.</i>
Particle size distribution measurement in breathing zone of the animals in case of aerosol exposure	<i>No</i>

Assessment of Reliability	<p>B1</p> <p><i>Study seems to meet the standards, though some details on study characteristics are missing. Limited to one exposure duration.</i></p> <p><i>There may be some issues with respect to the reliability of the analytical method used at that time.* It is however noted that the difference between the nominal and analytical concentration is quite limited. Further, the nominal concentration is, except for the two highest test concentrations (with 100% lethality), < 25% of the saturated vapour concentration.</i></p>
---------------------------	---

* IDLH states that the tetraethyl lead analytical methods prior to 1968 were not reliable. However, the basis for their statement is not clear.

Results

Species	Concentration (mg/m ³)		Exposure duration (min)	Lethality
	Measured	Adjusted		
				Dead/tested
Rat	0.08 × 10 ³	NA	60	0/16
Rat	0.17 × 10 ³	NA	60	0/16
Rat	0.34 × 10 ³	NA	60	0/20
Rat	0.66 × 10 ³	NA	60	3/16
Rat	1.50 × 10 ³	NA	60	16/16
Rat	2.64 × 10 ³	NA	60	20/20
Rat	3.87 × 10 ³	NA	60	12/12

Probit function

The probit function and associated LC-values have been calculated using the DoseResp program (Wil ten Berge, 2016) as

$$Pr = a + b \times \ln C$$

with C for concentration in mg/m³.

Probit function	Species	a	b	n-value
	Rat	-76.8	12.5	N/A

Duration (min.)	LC ₅₀ (mg/m ³) 95%-C.I.
60	709 (C.I. could not be calculated)

The study authors reported a 60-min LC₅₀ of 0.85 × 10³ mg/m³.

No C × t probit function could be calculated from these data alone.

1 **Study ID: C studies**

2

3 Akatsuka (1973) reports a 7-hour LC_{Lo} of 650 mg/m³ for mouse. Further details are
4 not provided.

5

6 IDLH mentions a rat LC₅₀ of 6 ppm (81 mg/m³). However no details on the exposure
7 duration and other study characteristics are provided. The original publication could
8 not be retrieved.

9

10 RTECS presents 2 hour inhalation LC₅₀ value for mouse of 48.52 mg/m³. Further
11 details are not provided. The original publication is in Russian language.
