

Pneumococcal vaccine 2025

Pneumococci are bacteria. An infection could cause a serious illness, such as pneumonia. People over 60 are more likely to become ill from a pneumococcal infection, and have a higher risk of becoming seriously ill. After getting the vaccine, you are less likely to get pneumococcal disease.

The vaccine offers
extra protection
against pneumonia

About pneumococci

- Pneumococci are bacteria that can make you ill.
- You are more likely to become ill if your immune system is weaker, for example because you are aged 60 years and older.
- After pneumococcal disease, you may have permanent health impacts.
- For example, you could develop pneumonia. In serious cases, you could even die.

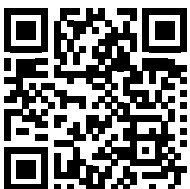

The vaccine offers protection

- After getting the vaccine, you have a lower risk of illness, hospital admission and death from pneumococcal disease.

In 2025, an invitation will be sent to 2 groups:

- People born in 1965.
- People born in or before 1947.
